

Acute Care Comes Home

Provide acute oversight while patients recover in the comfort of their own homes.

With Care Innovations® Hospital at Home Solutions, you can now create new service line revenue by providing acute oversight while patients recover in the comfort of their own homes and bill at inpatient reimbursement rates.

The Hospital at Home* (HaH) care model provides extended care from the hospital to the home for acute patients with conditions ranging from asthma and pneumonia to congestive heart failure in a home setting. Stable post-op and ICU patients also can use the Hospital at Home care model.

The Centers for Medicare and Medicaid Services (CMS) states that under this model, the patient home is considered part of the hospital during the tenure of care.

Innovative hospitals can provide broad range of acute care services in the home setting facilitated by connected health technologies and well-crafted clinical care protocols.

Transforming Care to the Home

- To accommodate the clinical demand from aging and chronic populations, new care models outside the hospital help balance limited hospital resources.
- Many US hospitals have already embraced Hospital at Home initiatives, with strong support from the government and payers.
- The model has proven to be a safe and effective care alternative for COVID-19 cases, allowing for treatment of less-severe and post-discharged patients remotely.
- Proven technologies and clinical services from Care Innovations have enabled leading hospitals to rapidly deploy acute care and patient monitoring at home.

careinnovations®

A Proven Platform for Success

Microsoft Azure

Globally scaled on the Microsoft Azure platform, Care Innovations Hospital at Home technologies deliver the security, reliability, and performance to help deliver the highest quality care and a stellar patient experience.

Improving Patient Engagement Improves Outcomes

- Shorten patients' length-of-stay
- Produce better patient outcomes
- Run fewer labs and diagnostics
- Reduce hospital stays & complications
- Save on traditional inpatient care
- Improve utilization
- Provide higher patient satisfaction
